1. Why is MLflow called an "experiment tracking" platform?

MLflow is called an experiment tracking platform because it records information about machine learning experiments and their individual runs. It can store parameters, metrics, artifacts, and other information associated with a run. This allows developers and data scientists to compare different experiments and reproduce successful results.

2. What problems does MLflow solve?

MLflow helps solve several problems in machine learning development, including:

- Difficulty tracking multiple experiments
- Losing track of model parameters and metrics

- Difficulty reproducing experiments
 - Managing different versions of models
 - Managing and sharing ML artifacts
 - Collaboration between ML developers and teams
 - Managing the transition of models from development to production
-

3. Can MLflow be used with TensorFlow?

Yes.

MLflow supports TensorFlow and Keras workflows. It can be used to track TensorFlow experiments and log model-related information.

4. Can MLflow be used with PyTorch?

Yes.

MLflow supports PyTorch. Developers can use it to track PyTorch experiments and manage information related to trained models.

5. Can MLflow be used with Scikit-Learn?

Yes.

MLflow provides support for Scikit-Learn models. Parameters, metrics, and trained models can be tracked and managed using MLflow.

6. Can MLflow be deployed using Docker?

Yes.

MLflow can be deployed and run using Docker containers. Docker provides an isolated and reproducible environment for running MLflow and its dependencies.

7. Which companies are using MLflow?

MLflow is used by organizations across the technology and machine-learning industry. Examples include **Microsoft, NVIDIA, Shopify, Comcast, and other organizations** for managing machine-learning workflows.
